Social Care Services Evidence Summary: Care Transition Services

This evidence summary includes a broad range of research/resources on care transitions services and is primarily focused on health care impact. It is not intended to be an exhaustive compilation of research/resources on this topic. The information presented in this summary can inform the value proposition of partnering with a community-based organization (CBO) or a network of CBOs to offer these services and supports as part of a strategy to address social determinants of health (SDOH).

Care transitions refer to the support provided to an individual as they transition from one care setting to another as their care needs change. Settings of care may include hospitals, ambulatory care, skilled nursing facilities, specialty clinics, long-term care facilities, rehabilitation centers, and the home.\(^1\)\(^2\) Poor transitions of care can lead to adverse health events, poor adherence to care plans, higher hospital readmission rates, and costly expenses. Care transition services include, but are not limited to, family caregiver education, health goal planning, medication adherence training, transition planning, patient-activated education and coaching, home visits, and risk assessments. A number of different care transitions models have emerged over the years, and studies to date indicate that these models have proven effective at improving health outcomes and reducing medical costs.

For specific, further detailed information on this evidence, please review the resources listed below.

<tbody>
<tr>
<td>Coleman et al. (2004)</td>
<td>1,393 community-dwelling adults aged 65+ admitted to the hospital with one of nine specified conditions in Colorado</td>
<td>To test whether the intervention encouraged older patients and their caregivers to assert a more active role during care transitions and led to reduced re-hospitalization rates.</td>
<td>Quasi-experimental design</td>
<td>The results of the study showed that intervention subjects had lower rates of re-hospitalization at 30-, 60-, and 90-days post-hospital discharge than control subjects. Intervention patients also reported high levels of confidence in obtaining necessary information for managing their condition, communicating with members of the healthcare team, and understanding their medication regime.</td>
</tr>
<tr>
<td>Coleman et al. (2006)</td>
<td>750 community-dwelling individuals admitted to the hospital with one of 11 selected conditions in Colorado</td>
<td>To implement the Care Transitions Intervention (CTI) on patients and observe their participation in their health and rates of re-hospitalization.</td>
<td>Randomized control trial</td>
<td>The findings of the study showed that the individuals who received the CTI had lower hospitalization rates at 30- and 90-days post discharge than control subjects, and the mean hospital costs were lower at 180-days post discharge for the intervention group.</td>
</tr>
<tr>
<td>Epstein-Lubow et al. (2014)</td>
<td>2,747 fee-for-service Medicare patients recruited during inpatient hospitalizations at six hospitals in Rhode Island</td>
<td>To evaluate the association between family caregiver presence and patient completion of the CTI.</td>
<td>Effectiveness trial</td>
<td>The results of the study showed that patients with family caregivers were more than five times as likely to complete the intervention as patients without caregivers.</td>

<tr>
<td>Kangovi et al. (2014)</td>
<td>683 eligible Medicaid patients and 446 control patients</td>
<td>To determine if tailored community health worker intervention would improve post-hospital outcomes among low socio economic status patients.</td>
<td>Two-armed, single-blind, randomized clinical trial</td>
<td>The results of the study showed that intervention patients were more likely to obtain timely post-hospital care, report high-quality discharge communication, and shower greater improvement in mental health than control patients.</td>
</tr>
<tr>
<td>The SCAN Foundation (2014)</td>
<td>The return on investment (ROI) calculator included data from 16 studies on the implementation of coordinated care models as well as 2012 Medicare data.</td>
<td>To utilize the ROI tool to provide an estimate of the financial returns associated with implementing each of the selected care models.</td>
<td>ROI</td>
<td>The ROI analysis showed that the care transition programs under study had a positive ROI, and a number of factors that contribute to this positive ROI were highlighted.</td>
